                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 day 5 in culture. mRNA was isolated from approximately 6000 molting larvae (mL3),2000 larvae from day 1, 2 or 3 in culture, and converted to double-stranded cDNA using reverse transcriptase and oligo(dT) followed by RNase H and DNA pol I. The library was constructed in the lambda Uni-Zap xR vector and has I x 1086 independent recombinants and the average insert size is -1200 bp. The Library was constructed by Sara Lustigman and Michelle Lizotte-Wanlewski in the Laboratory of Dr. S. A. Williams. The library is available from Dr. Sara Lustigman (email:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               //note="Vector: Lambda Uni-ZAP XR; Site_1: Eco RI; Site_2: Xho I; Filarial nematode parasite of humans. Third-stage larvae, L3, were isolated from infected black files in Cameroon (forest strain). The L3 were cultured in 20% FCS in IMDM+ NCTC 135 and collected after day 1, 2, or 3 in culture. L3 of 0. volvulus molt to fourth-stage larvae by day 5 in culture. mRNA was isolated from approximately 6000 molting larvae (mL3),2000 larvae from day 1, 2 or 3 in culture, and converted to double-stranded cDNA using reverse transcriptase and oligo(dT) followed by RNase H and DNA pol I. The library was constructed in the lambda Uni-Zap XR vector and has 1 x 10E6 independent recombinants and the average insert size is -1200 bp. The library was constructed by Sara Lustigman and Michelle Lizotte-Waniewski in the Laboratory of Dr. S. A. Williams. The library is available from Dr. Sara Lustigman (email: $123 of 123 of 180 the constructed in the laboratory of Dr. S. A. Williams.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /note="vector: pamp1 (Gibco); Site_1: NotI; Site_2: SalI; The library was constructed by Brandi Chiapelli and Dr. James McCarter at Washington University, St. Louis. The cDNA was made by using Dynabead oligo-dT priming (Dynal). PCR based library using a modified protocol from the SMART PCR CDNA Synthesis Kit from Clontech. Directionally cloned into the UDG sites of pamp1. Nematodes were provided by Dr. David Bird and Daniel Snyder of North Carolina State University."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Aho I; Filarial nematode parasite of humans. Third-stage larvae, L3, were isolated from infected black files in Cameroon (forest strain). The L3 were cultured in 20% FCS in IMDM+ NCTC 135 and collected after day 1, 2, or 3 in culture. L3 of 0. volvulus molt to fourth-stage larvae by day 5 in culture mRNA was isolated from approximately 6000 molting larvae (mL3),2000 larvae from day 1, 2 or 3 in culture, and converted to double-stranded cDNA using reverse transcriptase and ollgo(dT) followed by RNase H and DNA pol I. The library was constructed in the lambda UN1-Zap XR vector and has 1 x 1026 independent recombinants and the average insert size is -1200 bp. The library was constructed by Sara Lustigman and Michelle Libotte-Waniewski in the Laboratory of Dr. S. A. Williams.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       genome@smith.edu

The cDNA was made by using Dynabead oilgo-dT priming (Dynal). PCR based library using a modified protocol from the SMART PCR cDNA Synthesis Kit from Clontech. Directionally cloned into the UDG sites of pAMP1. Dissected nematode tissues were provided by Dr. Alan Scott (ascotte)hsph.edu) of the School of Public Hygene and Public Health at John Hopkins University in Baltimore, MD. Seq primer: -40RP from Gibco High quality sequence stop: 389.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              in culture, and converted to double-stranded cDNA using reverse transcriptase and oligo(dT) followed by RNase H and DNA pol I. The library was constructed in the lambda Uni-Zap XR vector and has 1 x 10E6 independent recombinants and the average insert size is-1200 bp. The library was constructed by Sara Lustigman and Michelle Lizotte-Waniewski in the Laboratory of Dr. S. A. Williams. The library is available from Dr. Sara Lustigman (email: slustigmaybc.org)."

Third-stage larvae, L3, were isolated from infected black flies in Cameroon (forest strain). The L3 were cultured in 20% FCS in IMDM+ NCTC 135 and collected after day 1, 2, or 3 in culture. L3 of 0. volvulus molt to fourth-stage larvae by day 5 in culture. mRNA was isolated from approximately do nolting larvae (mL3),2000 larvae from day 1, 2 or 3
volvulus.

Third-stage larvae, L3, were isolated from infected black files in Cameroon (forest strain). The L3 were cultured in 20% FCS in IMDM+ NCTC 135 and collected after day 1, 2, or 3 in culture. L3 of 0. volvulus molt to fourth-stage larvae by day 5 in culture. mRNA was isolated from approximately 6000 molting larvae (mL3),2000 larvae from day 1, 2 or 3 in culture, and converted to double-stranded cDNA using reverse transcriptase and oligo(dT) followed by RNAse H and DNA pol I. The library was constructed in the lambda Uni-Zap XR vector and has 1 x 10E6 independent recombinants and the average insert size is -1200 bp. The library was constructed by Sara Lustigman and Michelle Lizotte-Raniewski in the Laboratory of Dr. S. A. Williams.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        larvae, 13, were isolated from infected black flies in Cameroon (forest strain). The L3 were cultured in 20% FCS in IMDM+ NCTC 135 and collected after day 1, 2, or 3 in culture. L3 of 0. volvulus molt to fourth-stage larvae by day 5 in culture. mRNA was isolated from approximately 6000 molting larvae (mL3),2000 larvae from day 1, 2 or 3 in culture, and converted to double-stranded cDNA using reverse transcriptase and oligo(dT) followed by RNase H and DNA pol I. The library was constructed in the lambda Uni-Zap XR vector and has 1 x 1026 independent recombinants and the average insert size is -1200 bp. The library was constructed by Sara Lustigman and Michelle Library is available from Dr. Sara Lustigman (email: slustigménybc.org).*

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cameroon (forest strain). The L3 were cultured in 20% FCS in INDM+ NCTC 135 and collected after day 1, 2, or 3 in culture. L3 of O. volvulus molt to fourth-stage larvae by day 5 in culture, mRNA was isolated from approximately 6000 molting larvae (mL3),2000 larvae from day 1, 2 or 3 in culture, and converted to double-stranded cDNA using reverse transcriptase and oligo(dT) followed by RNAse H and DNA pol I. The library was constructed in the lambda Uni-Zap XR vector and has 1 x 10E6 independent recombinants and the average insert size is -1200 bp. The library was constructed by Sara Lustigman and Michelle Library was constructed by Sara Lustigman and Michelle Library is available from Dr. Sara Lustigman (email: slustigm@nybc.org)."

Third-stage larvae, L3, were isolated from infected black flies in Cameroon (forest strain). The L3 were cultured in 20% FCS in IMDM+ NCTC 135 and collected after day 1, 2, or 3 in culture. L3 of 0. volvulus molt to fourth-stage larvae by day 5 in culture. mRNA was isolated from approximately 6000 molting larvae (mL3),2000 larvae from day 1, 2 or 3 in culture, and converted to double-stranded cDNA using reverse transcriptase and oilgo(dT) followed by RNase H and DNA pol I. The library was constructed in the lambda Uni-Zap XR vector and has 1 x 10E6 independent recombinants and the average insert size is -1200 bp. The library was constructed by Sara Lustigman and Michelle Lizotte-Wanlewski in the Laboratory of DT. S. A. Williams.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      in IMDM+ NCTC 135 and collected after day 1, 2, or 3 in culture. I3 of O. volvulus molt to fourth-stage larvae by day 5 in culture. mRNA was isolated from approximately 6000 molting larvae (mL3),2000 larvae from day 1, 2 or 3 in culture, and converted to double-stranded cDNA using reverse transcriptase and oligo(dT) followed by RNase H and DNA pol I. The library was constructed in the lambda Uni-Zap XR vector and has 1 x 10E6 independent recombinants and the average insert size is -1200 bp. The library was constructed by Sara Lustigman and Michelle Lizotte-Waniewski in the Laboratory of Dr. S. A. Williams. The library is available from Dr. Sara Lustigman (email: slustigmenybc.org)."

The Dirofilaria immitis nucleic acid molecule is useful as a probe to identify nucleic acid molecules, as a primer to produce nucleic acids, as a therapeutic reagent, e.g., gene therapy to inhibit cuticlin activity or production, or in a vaccine to prevent infection with helminth parasites. The cuticlin protein, antibodies raised against it, and inhibitory compounds of cuticlin may all be used in compositions to protect animals, especially mammals such as cats, dogs, and humans. The antibodies may be used to passively immunize an animal, or as reagents in assay to detect infection of helminths, or as tools to screen expression libraries to recover desired proteins. They may also be used to target cytotoxic agents to the parasite and kill it directly. The present sequence represents a cuticlin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   isolated cDNA clone (see ABL57372). The protein sequence has 918 identity to the Ascaris homologue. The invention provides D. immitis and Brugia malayi parasitic helminth cuticlin proteins, nucleic acids, antibodies, compounds that inhibit cuticlin activity, and methods of obtaining them. Therapeutic compositions comprising such proteins, nucleic acids, antibodies and/or inhibitors, including genetic vaccines, recombinant virus vaccines and recombinant cell vaccines, are used to protect animals from diseases caused by parasitic helminths, and to inhibit the moulting of filariid larvae in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is the protein sequence of novel Dirofilaria immitis cutillin DiCut-la, as predicted from an

The Dirofilaria immitis nucleic acid molecule is useful as a probe to identify nucleic acid molecules, as a primer to produce nucleic acids, as a therapeutic reagent, e.g., gene therapy to inhibit cuticlin activity or production, or in a vaccine to prevent infection with helminth parasites. The cuticlin protein, antibodies raised against it, and inhibitory compounds of cuticlin may all be used in compositions to protect animals, especially mammals such as cats, dogs, and humans. The antibodies may be used to passively immunize an animal, or as reagents in assay to detect infection of helminths, or as tools to screen expression libraries to recover desired parasite and kill it directly. The present sequence represents a cuticlin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel nucleic acid molecule encoding a Dirofilaria immitis cuticlin protein is useful as a vaccine to prevent parasitic helminth infection

                                                                                                                                                                 The present sequence is the protein sequence of novel Brugia malayi cuticlin BmCut-lA, as predicted from an isolated partial CDNA clone (see ABL57374). The invention provides B. malayi and Dirofilaria immitis parasitic helminth cuticlin proteins, nucleic acids, antibodies, compounds that inhibit cuticlin activity, and methods of obtaining them. Therapeutic compositions comprising such proteins, nucleic acids, antibodies and/or inhibitors, including genetic vaccines, recombinant virus vaccines and recombinant cell vaccines, are used to protect animals from diseases caused by parasitic helminths, and to inhibit the moulting of filariid larvae in an animal.

                                                                                                                                                                                                                                                                                                  The specification describes a Dirofilaria immitis nucleic acid molecule, that encodes a cuticlin protein. The Dirofilaria immitis nucleic acid molecule is useful as a probe to identify nucleic acid molecules, as a primer to produce nucleic acids, as a therapeutic reagent, e.g., gene therapy to inhibit cuticlin activity or production, or in a vaccine to prevent infection with helminth parasites. The cuticlin protein, antibodies raised against it, and inhibitory compounds of cuticlin may all be used in compositions to protect animals, especially mammals such as cats, dogs, and humans. The antibodies may be used to passively immunize an animal, or as reagents in assay to detect infection of helminths, or as tools to screen expression libraries to recover desired parasite and kill it directly. The present sequence represents a cuticlinarion contains.

The protein sequence has 81% identity to the Ascaris homologue. The invention provides D. immitis and Brugia malayi parasitic helminth cuticlin proteins, nucleic acids, antibodies, compounds that inhibit cuticlin activity, and methods of obtaining them. Therapeutic compositions comprising such proteins, nucleic acids, antibodies and/or inhibitors, including genetic vaccines, recombinant virus vaccines and recombinant cell vaccines, are used to protect animals from diseases caused by parasitic helminths, and to inhibit the moulting of filariid larvae in an animal.
                                                                                                                                                                                                                                                 Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        B
                                                          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL10151-ABL30511), expressed DNA sequences (ABL01040-ABL16175) and the encoded proteins
                                 The sequence data for this patent did not form specification, but was obtained in electronic i

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ş
                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL13511), expressed DNA sequences (ABL16175, and the encoded proteins (ABB57737-ABB72072).

The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher entaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB16737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                             capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB737737-ABB72072).
                                                                                                                                                                       Sequence
                                                                                                                                                                                                                            specification, but was obtained in electronic format directly from

The inventiuseful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL01867-ABL30511), expressed DNA sequences (ABL0187-ABB72072).
